What did I do last week?

I was able to complete the authentication with Firebase and React.js to get my website mostly functioning. To integrate with Shopify, I've concluded that performance will be more user friendly if I use Shopify Polaris for design of the website. I began work to translate what I've done to work with Shopify Polaris and other Shopify tools that are also recommended by Shopify.

I met with my brother again this week about the progress of the website. I told him that the layout I showed him will not reflect the final product. He is okay with that, and is excited for this product to add functionality to his Shopify store.

What will I do this week?

I will present my project goals and description to my classmates. The end of the class will mark the end of this iteration of work for PickShip, and then my focus will end on getting the UI to work accordingly.

What didn't go well?

Rather than other things demanding my attention this week, most of my time was spent fighting the Shopify backend and development environment. I was hoping for the transition from using React.Js by itself to adding in Shopify tools to be easier than this, but progress will happen as I continue to learn and get the hang of Shopify's API.
