What did I do this week?

I was able to come to a good idea of what I want PickShip to look like. I created a working login page using Firestore and react.js. People I asked said that they like the layout and the way that the page looks. I presented my plan to my brother and showed him my wireframes and what I have gotten done so far. He likes what I have and added some more features to his feature list. He would like there to be a different picklist for both online orders and floor stock replenishment.

My project did not see much improvement this week. Most of my time was spent at work and working to study for finals. Thankfully, I've been able to organize the things I've needed to do and prioritize them first and then put other things on the backburner that aren't as important for these coming weeks.

What will I do next week?

I will continue working to integrate Shopify authentication and firestore into PickShip. I have the login page working with firebase, but it is not working with Shopify to verify the user authenticated to use the program functionality.

What didn't go well?

A lot of items for this project have been moved to be less pressing than the other work I need to complete for my classes. It looks like I'm going to have to push this project back and decrease the amount of features I'll get done in this iteration of work.
